Multi sampler, fast VST to DAW, ready-to-use presets, full featured mixer, etc.... The main advantage of a sequencer is the ability to arrange multiple audio clips into a musical track. Other than that, it's a simple platform for arranging audio and creating more complex files. The latter are called MIDI files or files with MIDI data in their format. If you don't know much about MIDI files, you should read the article on what MIDI files are and what they can do for you. The first MIDI file to create is the instrument definition – the first thing you'll see when you open a new MIDI file. As you're probably aware, the instrument definition includes all the settings that you can tweak in your audio sequencer – like the synth and FX settings. In most cases, you'll want to use a well-known instrument definition, like the Roland SF-01 MPD, or the ESX-1. The instrument definition also contains the key parameters. The first key parameter is the instrument name and is a string containing the name of your instrument. The second is the instrument type – which is a numerical value that describes the instrument's architecture. To find out the instrument type of your instrument definition, hover over the instrument type (or press the Ctrl key on your keyboard) and you'll see the corresponding numbers in the lower part of the definition. For example, the Roland SF-01 MPD is a CS-80A and that would have the instrument type of 040. MIDI Events The other big part of a MIDI file is the MIDI events. These include an important set of parameters that define everything from the tempo to the pitch bend and aftertouch. Most MIDI sequencers have a default setting for MIDI events – some have the ability to use other parameters than default, but they're not that common. The tempo is usually set to the BPM (beats per minute) of the piece and represents the number of bars the track has. If you're familiar with playing music, you'll know that a 2/4 measure has four beats. The BPM value is based on the time between each beat, so you'll probably need to tweak it to get the right tempo. The pitch and key are usually the same as the instrument definition and are an indication of the pitch and key of the sound you 81e310abbf

The drum MIDI files you use in your project will determine how detailed and complex your drum sounds are. If you're using drum samples or drum kits with lots of sound variations, you'll want to use multiple drums in your track. The following are a list of the drum sounds we recommend using: Kicks: A high-pitched clap, conga, or rim shot can be very impressive in the mix. Claps: A hand clap is great for a more energetic feel. Rim Shots: A rim shot has a very wide sound and you can use a rim shot and a high hat for a large sound. Toms: A deep toms sound is best used for long bass drum hits. Side Toms: A side toms is perfect for a short groove or a fill. Bass Drums: A deep bass drum is great for punch and bass. Snare: A snare is a must in almost any song. Rushes: A snare can be very busy sounding when it is played hard. Snares: A snares is a more mellow snare that adds a lot of sweetness to a track. Hammer-on: A subtle type of clap is great to add to your track. Crepe: A hand clap is best for a subtler feel. Congas: A conga is a big hit. Hi Hats: A high hat is a very crisp sound.
